

Play value

The round concrete columns build unwavering confidence, and playing in the ropes and nets between them is fun.

Climbing requires, above all, gripping skills and it allows children to strengthen their innate self-protective reflex.

Assembly is simple (concrete in in-situ concrete). In addition, **inspecting the system and checking its structural stability** is very easy compared to other systems.

The large diameter of the **columns** made of reinforced concrete C40/50 ensures durability. So the main purpose of concrete column checks is to determine whether the stability of the columns has been affected by vandalism.

All ropes and fittings are of proven Richter quality and can be inspected easily.

Safety

The Rope Course is delivered according to the current European Standard for Play Equipment, DIN EN 1176.

A safety inspection and safety approval can be carried out following installation on-site. As laid down in the standard, there is no free fall height of more than 3 m.

Delivery and assembly take place in 2 steps:

1. Ground works
2. Assembly of concrete columns and playground equipment
